CITRIO
JUICER

5 Weeks 1

Redesign of an existing manual orange juicer into a motorized, user-friendly system.

Context

The existing orange juicer requires manual effort to maintain and cranking the process repetitive and less convenient for the user. This project focuses on redesigning it with a motorized extraction mechanism to reduce effort, improve efficiency, provide better stability, and make the overall juicing process more user-friendly.

- MOTORIZED EXTRACTION
- REVISED COVERING DESIGN
- BUTTON OPERATION

"Freshly squeezed, effortlessly made."

Reasearch

- Conducted primary research through 10 user interviews and a Google survey with 50+ respondents.
- Observed 15+ users interacting with existing juicers to understand usage behaviour and pain points.
- Conducted competitive benchmarking of 10+ existing juicers across features, mechanisms and usability.
- Created User Journey Mapping and Empathy Mapping to identify key user needs and pain points.

01 — Physical Effort
Users need effortless motor-assisted juicing.

02 — Juice Extraction
Users need consistent and maximum juice extraction.

03 — Time and Cleaning
Users need a faster, simpler juicing process,Users need flexes removable parts and easy cleaning.

04 — Stability and Operation
Users need a stable product that stays firmly in place,Users need simple one-button operation

05 — Space
Users need a compact form suitable for small kitchens.

06 — Safety
Users need enclosed and safe moving mechanisms.
